

## **FRR**

Advantech Czech s.r.o., Sokolska 71, 562 04 Usti nad Orlici, Czech Republic Document No. APP-0100-EN, revision from 14th January, 2025.

# **Used symbols**

Danger – Information regarding user safety or potential damage to the router.

Attention – Problems that can arise in specific situations.

Information – Useful tips or information of special interest.

## **Contents**

# 1. Changelog

This Router App has been tested on a router with firmware version 6.3.10. After updating the router's firmware to a higher version, make sure that a newer version of the Router App has not also been released, as it is necessary to update it as well for compatibility reasons.

## 1.1 FRR Changelog

#### v1.0.0 (2020-11-20)

First release

#### v1.0.1 (2021-01-19)

· Added staticd

#### v1.1.0 (2021-12-07)

- Upgraded to version 7.5.1
- Added LDP/MPLS support
- Aded VRF support
- For proprer MPLS function is FW 6.3.3+ needed

#### v1.1.1 (2022-02-01)

- · Fixed FRR routing daemons stopping/restarting
- · Fixed MPLS init script

#### v1.2.0 (2022-06-16)

Updated FRR to version 8.2.2

#### v1.3.0 (2022-11-03)

· Reworked license information

#### v8.4.2 (2023-03-17)

• Updated FRR to version 8.4.2

#### v8.5.4 (2024-02-01)

- Updated FRR to version 8.5.4
- Recompiled with ModulesSDK 2.1.0
- · Added description and summary files

#### v8.5.4-1 (2024-03-05)

• Fixed description and summary files

## v10.2.1 (2025-01-07)

- Updated FRR to version 10.2.1
- Limited settings editing for administrators only
- Added PIM-SM
- Added integrity checks for the -S1 platforms

# 2. Router App Description

#### 2.1 Introduction

FRRouting (FRR) is a robust and versatile IP routing protocol suite designed for Linux and Unix platforms. It offers a comprehensive range of protocol daemons, empowering users to implement sophisticated routing solutions with ease.

Building on the power and flexibility of *FRR*, Advantech has developed the innovative *FRR* router app. This application enhances the router's capabilities by supporting an extensive array of routing protocols, including BGP, IS-IS, LDP, MPLS, NHRP, OSPF, OSFP6, PIM-SM, RIP, RIPNG, Static, VRF, and Zebra. With this advanced functionality, the *FRR* router app equips users with the tools to address complex networking demands and ensures seamless, efficient data routing across diverse environments.

#### 2.2 Installation

This router app is not installed on *Advantech* routers by default. However, you can get the \*.tgz installation file on the *Engineering Portal*<sup>1</sup>.

This router app can be installed to the router in the router's GUI by clicking  $Customization \rightarrow Router Apps \rightarrow Add \ or \ Update \ button.$ 

<sup>1</sup>https://icr.advantech.com/products/software/user-modules#frr

## 3. Web Interface

Once the installation of the *FRR* Router App is complete, its GUI can be invoked by clicking the module name on the Router apps page of router's web interface.

Left part of this GUI contains menu with *Status* menu section, *Configuration* menu section and *Information* menu section. *Administration* menu section contains only the *Return* item, which switches back from the app's web page to the router's web configuration pages. The main menu of app's GUI is shown on Figure 2.

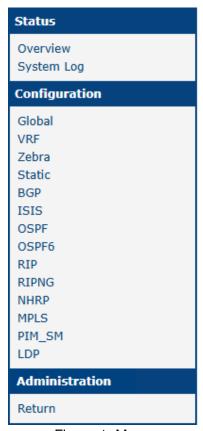

Figure 1: Menu

## 4. Status

In this section, in the *Overview* part, you can see the status of all protocols which can be configured via the *FRR* Router App. The figure below is an example of the Zebra protocol running.

```
Status Overview
                                              Services
Protocol zebra is running
FRRouting 7.5 (Router).
Router# show ip route
Codes: K - kernel route, C - connected, S - static, R - RIP,
O - OSPF, I - IS-IS, B - BGP, E - EIGRP, N - NHRP,
T - Table, v - VNC, V - VNC-Direct, A - Babel, D - SHARP,
F - PBR, f - OpenFabric,
        > - selected route, * - FIB route, q - queued, r - rejected, b - backup
K>* 0.0.0.0/0 [0/0] via 192.168.253.254, usb0, 00:05:02
C>* 10.64.0.0/22 is directly connected, eth0, 00:05:02
C>* 10.65.0.0/22 is directly connected, eth1, 00:05:02
C>* 10.80.0.85/32 is directly connected, usb0, 00:05:02
K>* 192.168.253.254/32 [0/0] is directly connected, usb0, 00:05:02
Router# show ipv6 route
Codes: K - kernel route, C - connected, S - static, R - RIPng,
       O - OSPFv3, I - IS-IS, B - BGP, N - NHRP, T - Table,
v - VNC, V - VNC-Direct, A - Babel, D - SHARP, F - PBR,
        f - OpenFabric,
        > - selected route, * - FIB route, q - queued, r - rejected, b - backup
C>* 64:ff9b::/96 is directly connected, nat64, 00:05:02
C>* fd00:a40::/56 is directly connected, eth0, 00:05:02

C>* fe80::/64 is directly connected, eth0, 00:05:02
```

Figure 2: Status Overview Example

In the System Log part, you can see a copy of the system log, also available in the router Status  $\rightarrow$  System Log.

# 5. Configuration

#### 5.1 Global

All Secure Syslog router app settings can be configured by clicking on the *Global* item in the main menu of module web interface. An overview of configurable items is given below.

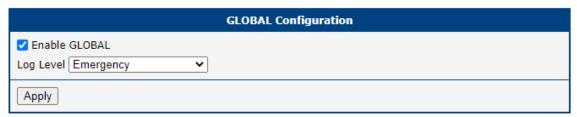

Figure 3: Global Configuration

Item	Description
Enable GLOBAL	Enables FRR functionality.
Log Level	Select what level of information will appear in log

Table 1: GLOBAL Configuration items description

#### 5.2 **VRF**

In IP-based computer networks, virtual routing and forwarding (VRF) is a technology that allows multiple instances of a routing table to co-exist within the same router at the same time. More about this protocol and examples can be found in the FRR online documentation<sup>1</sup>.

There are more configuration pages for the VRF configuration under  $Customization \rightarrow Router\ Apps \rightarrow FRR \rightarrow Configuration \rightarrow VRF$  menu item. The first, see Figure 4, is for the global VRF configuration. You can enable/disable the VRF globally and enable the TCP/UD l3mdev (the L3 master device) access here as well.

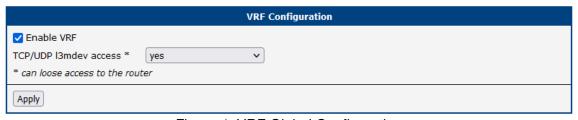

Figure 4: VRF Global Configuration

<sup>1</sup>http://docs.frrouting.org/en/latest/zebra.html?highlight=vrf#clicmd-vrf-VRF

Next are configuration pages for individual VRF interface configurations; see Figure 5.

VRF1 Configuration				
✓ Enable VRF1				
VRF name	vrf-red			
VRF Interface	eth0 v			
Apply				

Figure 5: VRF Interface Configuration

#### 5.3 Static

Static routing is a form of routing that occurs when a router uses a manually-configured routing entry, rather than information from dynamic routing traffic. More about configuring and examples can be found in the FRR online documentation<sup>1</sup>.

```
STATIC Configuration

Enable STATIC

!
! Default configuration with enabled vty
! Change password!!!
!
! password conel
enable password conel
!
line vty
!

Apply
```

Figure 6: Static Configuration

<sup>1</sup>http://docs.frrouting.org/en/latest/static.html

#### 5.4 Zebra

Zebra is an IP routing manager, It provides kernel routing table updates, interface lookups, and redistribution of routes between different routing protocols. More about configuring and examples can be found in the text below or in the FRR online documentation<sup>1</sup>.

An example of the zebra configuration file (zebra.conf):

```
!
password conel
enable password conel
log syslog
!
interface eth0
!
interface eth1
!
interface tun0
!
interface ppp0
!
!!
line vty
```

Figure 7: Configuration of zebra deamon

http://docs.frrouting.org/en/latest/zebra.html

#### 5.5 BGP

Border Gateway Protocol (BGP) is a standardized exterior gateway protocol designed to exchange routing and reachability information between autonomous systems (AS) on the Internet. More about configuring and examples can be found in the text below or in the FRR online documentation<sup>1</sup>.

Due to this module it is possible to used the routing between autonomous systems. These systems might be perceived as a group of IP networks and routers under the control of one or more network operators that presents a common clearly defined routing policy (only one of interior gateway protocols). The routing information is exchanged between autonomous systems via border gateway.

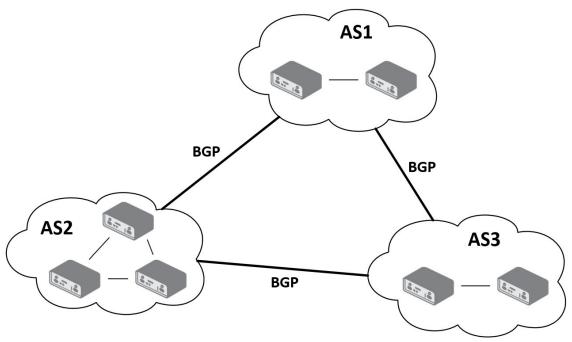

Figure 8: Model scheme

#### Important notices:

- Using telnet is vty interface of zebra and bgpd deamons available only via the loopback interface 127.0.0.1.
- New configuration files should be created only by an experienced user!

#### 5.5.1 Example of Configuration

The figure below shows a model situation of using the *BGP* router app. Then there are mentioned examples of configuration files of *zebra* and *bgpd* deamons. In this form are entered in the configuration form in the web interface *BGP* or *ZEBRA*.

An example of the *bgpd.conf* configuration file for a device which is referred to as *Advantech router 1* in the figure above:

<sup>1</sup>http://docs.frrouting.org/en/latest/bgp.html

#### 5.5.2 BGP Basic commands

The following table lists basic commands which can be used when editing *bgpd.conf* file and description of these commands:

Item	Description
router bgp <asn></asn>	Configures the BGP routing process for ASN (autonomous system number)
no router bgp <asn></asn>	Removes a routing process from ASN
bgp router-id <ip-address></ip-address>	Configures a fixed router ID for a BGP-speaking router
no bgp router-id <ip-address></ip-address>	Removes the <i>bgp router-id</i> command from the configuration file and restore the default value of the router ID
distance bgp <1-255><1-255> <1-255>	Allows the use of external, internal, and local distances that could be a better route to a node
no distance bgp	Returns distances to the default values (20, 200, 200)
network <network-number></network-number>	Specifies the list of networks for the BGP routing process
no network <network-number></network-number>	Removes network from the list
aggregate-address <address></address>	Creates an aggregate entry in a BGP routing table
no aggregate-address <address></address>	Disables this function
bgp log-neighbor-changes	Enables logging of BGP neighbor resets
no bgp log-neighbor-changes	Disables logging of changes
neighbor <ip-address peer=""> remote-as <number></number></ip-address>	Adds an entry to the BGP neighbor table
no neighbor <ip-address peer=""> remote-as <number></number></ip-address>	Removes an entry from the BGP neighbor table
neighbor <ip-address peer=""> next-hop-self</ip-address>	Disables next-hop processing of BGP updates on the router
no neighbor <ip-address peer=""> next-hop-self</ip-address>	Disables this feature
neighbor <ip-address peer=""> version <version></version></ip-address>	Sets up the neighbor's BGP version (4, 4+, 4-)
neighbor <name> peer-group</name>	Defines a new BGP peer group
no neighbor <name> peer-group</name>	Removes the peer group and all of its members
show ip bgp	Displays entries in the BGP routing table

Table 2: BGP Basic commands

#### 5.6 ISIS

IS-IS (Intermediate System – Intermediate System) is routing protocol, which is designed for the exchange of routing information between routers. More about this protocol and examples can be found in *IS-IS Application Note* [1] or in the FRR online documentation<sup>1</sup>.

```
ISIS Configuration

✓ Enable ISIS

!
line vty
!
```

Figure 12: IS-IS Configuration

#### 5.7 OSPF & OSPF6

OSPF and OSPF6 which is IPv6 version of this protocol, are designed for exchanging routing information within an autonomous system. The OSPF is a link state protocol, which means that routers maintain a map of the network (link state database) that is updated after any change to the network topology. To computes the shortest (least cost) path between the router and all the networks is used Dijkstra's algorithm. Then these data are filled in the routing table. More about this protocol and examples can be found in the text below or in the FRR online documentation<sup>12</sup>.

Due to this module the OSPF routing protocol is available. This protocol is designed for exchanging routing information within an autonomous system. The OSPF is a link state protocol, which means that routers maintain a map of the network (link state database) that is updated after any change to the network topology. To computes the shortest (least cost) path between the router and all the networks is used Dijkstra's algorithm. Then these data are filled in the routing table.

ipv6 ospf6 hello-interval 10
ipv6 ospf6 retransmit-interval 5
router ospf6
router-id 220.0.0.2
redistribute connected
redistribute static
interface eth0 area 0.0.0.0
interface eth1 area 0.0.0.0
```

#### 5.7.4 OSPF Basic commands

The following table lists basic commands which can be used when editing *ospfd.conf* and *ospf6d.conf* files and description of these commands:

Item	Description
router ospf	Enables the OSPF process
no router ospf	Disables the OSPF process
ospf router-id <ip-address></ip-address>	Sets the router-ID of the OSPF process
no ospf router-id	Forces OSPF to use the previous OSPF router-id behavior
log-adjacency-changes	Configures the router to send a syslog message when an OSPF neighbor goes up or down
no log-adjacency-changes	Turns off log-adjacency-changes function
network <address> area <areaid></areaid></address>	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces
no network <address> area <area-id></area-id></address>	Disables OSPF routing for interfaces defined with address
area <area-id> range <address mask=""></address></area-id>	Consolidates and summarizes routes at an area boundary
no area <i><area-id></area-id></i> range <i><address mask=""></address></i>	Disables this function
area <area-id> authentication</area-id>	Enables authentication for an OSPF area
no area <i><area-id></area-id></i> authentication	Removes an area's authentication
ip ospf authentication-key <pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>	Assigns a password to be used by neighboring routers that are using OSPF's simple password authentication
no ip ospf authentication-key <pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre>	Removes a previously assigned OSPF password
ip ospf cost <cost></cost>	Specifies the cost of sending packet on an interface
no ip ospf cost	Resets the path cost to the default value
ip ospf dead-interval <seconds></seconds>	Sets how long hello packets must not have been seen before its neighbors declare the router down
no ip ospf dead-interval	Returns to the default time
ip ospf hello-interval <seconds></seconds>	Specifies the interval between hello packets that are sending on the interface
no ip ospf hello-interval	Returns to the default time
ip ospf priority <number></number>	Sets the router priority (0-255)
redistribute <protocol></protocol>	Redistributes routes from one routing domain into another domain
no redistribute <protocol></protocol>	Disables redistribution
default-metric	Sets default metric values for the OSPF routing protocol
no default-metric	Returns to the default state
show ip ospf	Displays general information about OSPF routing processes
show ip ospf interface	Displays OSPF-related interface information
show ip ospf neighbor	Displays OSPF-neighbor information

Table 3: OSPF Basic commands

#### 5.8 RIP & RIPNG

RIP and RIPNG which is an IPv6 version of RIP, allows the routers to communicate with each other and react to changes in network topology. The RIP is a distance-vector protocol, which means that routers send each other updated routing tables (don't know the entire network topology). More about this protocol and examples can be found in the text below or in the FRR online documentation<sup>12</sup>.

Due to this module the RIP routing protocol is available. Allows the routers to communicate with each other and react to changes in network topology. The RIP is a distance-vector protocol, which means that routers send each other updated routing tables (don't know the entire network topology). Searching the shortest paths in the network is based on the Bellman-Ford's algorithm. The decisive factor is the number of routers leading to the destination network. In terms of safety (protection against routing loops), this number is limited to 15. However, this maximum also limits the size of a network.

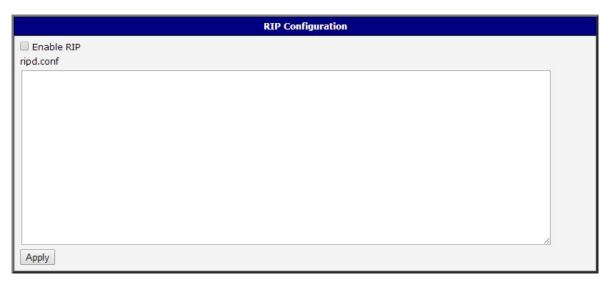

Figure 15: RIP web interface

#### Important notices:

- Using telnet is vty interface of zebra and ripd deamons available only via the loopback interface 127.0.0.1.
- New configuration files should be created only by an experienced user!

#### 5.8.1 Example of configuration

The figure below shows a model situation of using the *RIP* router app. Then there are mentioned examples of configuration files of *zebra* and *ripd* deamons. In this form are entered in the configuration form in the web interface *RIP* or *ZEBRA*.

<sup>1</sup>http://docs.frrouting.org/en/latest/ripd.html

<sup>2</sup>http://docs.frrouting.org/en/latest/ripngd.html

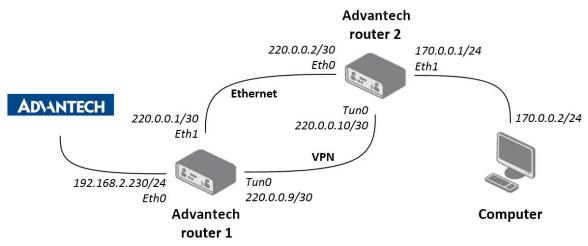

Figure 16: Example of configuration

## 5.8.2 IPv4 Configuration

An example of the *ripd.conf* configuration file for a device which is referred to as *Advantech router 1* in the figure above:

```
!
password conel
enable password conel
log syslog
!
interface eth0
!
interface eth1

```

## 5.8.3 IPv6 Configuration

An example of the *ripngd.conf* configuration file for a device which is referred to as *Advantech router 1* in the figure above:

```
!
password conel
enable password conel
log syslog
!
router ripng
!
network eth0
network eth1
!
passive-interface eth0
```

An example of the *ripngd.conf* configuration file for a device which is referred to as *Advantech router 2* in the figure above:

```
!
password conel
enable password conel
log syslog
!
router ripng
!
network eth0
network eth1
!
! passive-interface eth1
```

#### 5.8.4 RIP Basic commands

The following table lists basic commands which can be used when editing *ripd.conf* and *ripngd.conf* files and description of these commands:

Item	Description
router rip	necessary command to enable RIP
no router rip	disables RIP
network <network></network>	sets the RIP enable interface by specified network
no network <network></network>	disables RIP for the specified network
network <ifname></ifname>	both the sending and receiving of RIP packets will be enabled on the port specified in this command
no network <ifname></ifname>	disables RIP on the specified interface
neighbor <ip-address></ip-address>	defines a neighboring router with which to exchange routing information
no neighbor <ip-address></ip-address>	disables the RIP neighbor
passive-interface <ifname></ifname>	sets the specified interface to passive mode, i.e. disables sending routing updates on an interface
passive-interface default	sets all inerfaces to passive mode
no passive-interface <ifname></ifname>	sets the specified interface to normal mode
ip split-horizon	enables the split horizon mechanism (information about the routing is never sent back on the same interface)
no ip split-horizon	disables the split horizon mechanism (enabled on each interface by default)
version <version></version>	specifies a RIP version used globally by the router (it can be either 1 or 2)
no version	resets the global version setting back to the default
ip rip send version <version></version>	specifies a RIP version to send on an interface basis
ip rip receive version <version></version>	specifies a RIP version to receive on an interface basis
show ip rip	shows RIP routes
show ip protocols	displays the parameters and current state of the active routing protocol process

Table 4: RIP Basic commands

#### **5.9 NHRP**

The NHRP implementation in this Router App does not support some proprietary Cisco extensions. If you want to use NHRP in conjunction with Cisco devices, consider the following options:

- Use FlexVPN by configuring it on the *IPsec* configuration page. See the *FlexVPN* application note for details.
- Install the dedicated NHRP Router App, which is called Protocol NHRP (DMVPN).

The Next Hop Resolution Protocol (NHRP) is an extension of the ATM ARP routing mechanism that is sometimes used to improve the efficiency of routing computer network traffic over Non-Broadcast, Multiple Access (NBMA) Networks. It can be used by a sender to determine a route with the fewest hops to a receiver. More about this protocol and configuration can be found in the text below or in the FRR online documentation<sup>1</sup>.

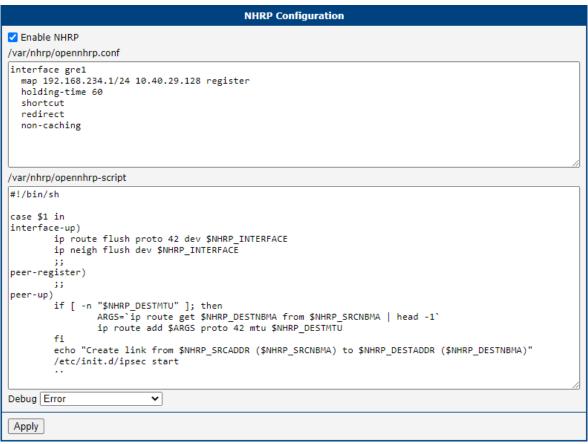

Figure 17: NHRP Configuration

http://docs.frrouting.org/en/latest/nhrpd.html

Field /var/nhrp/opennhrp.conf – insert the following configuration. It is to register the proper interface to the NHRP headquarter hub router and other needed parameters (edit to your own needs).

```
interface gre1
map 192.168.234.1/24 10.40.29.128 register
holding—time 60
shortcut
redirect
non—caching
```

Field /var/nhrp/opennhrp-script – this is the OpenNHRP script to define the behavior in various situations. You can left it unchanged. If you accidentally edit it, you can copy it from the next page.

Press the *Apply* button to save the changes. Use the same procedure for all spokes – the *NHRP Configuration* remains the same for all the spoke routers.

#### Field /var/nhrp/opennhrp-script

```
#!/bin/sh
case $1 in
interface—up)
ip route flush proto 42 dev $NHRP INTERFACE
ip neigh flush dev $NHRP_INTERFACE
peer-register)
peer-up)
if [ -n "$NHRP DESTMTU" ]; then
ARGS=`ip route get $NHRP DESTNBMA from $NHRP SRCNBMA | head -1`
ip route add $ARGS proto 42 mtu $NHRP DESTMTU
echo "Create link from $NHRP SRCADDR ($NHRP SRCNBMA) to $NHRP DESTADDR ($NHRP DESTNBMA)"
/etc/init.d/ipsec start
peer-down)
echo "Delete link from $NHRP SRCADDR ($NHRP SRCNBMA) to $NHRP DESTADDR ($NHRP DESTNBMA)"
if [ "$NHRP PEER DOWN REASON" != "lower-down" ]; then
/etc/init.d/ipsec stop
ip route del $NHRP DESTNBMA src $NHRP SRCNBMA proto 42
;;
route-up)
echo "Route $NHRP DESTADDR/$NHRP DESTPREFIX is up"
ip route replace $NHRP_DESTADDR/$NHRP_DESTPREFIX proto 42 via $NHRP_NEXTHOP dev $NHRP_INTERFACE
ip route flush cache
;;
route-down)
echo "Route $NHRP DESTADDR/$NHRP DESTPREFIX is down"
ip route del $NHRP DESTADDR/$NHRP DESTPREFIX proto 42
ip route flush cache
;;
esac
exit 0
```

## 5.10 MPLS

Multiprotocol Label Switching (MPLS) is a routing technique in telecommunications networks that directs data from one node to the next based on labels rather than network addresses. Whereas network addresses identify endpoints, the labels identify established paths between endpoints. MPLS can encapsulate packets of various network protocols, hence the multiprotocol component of the name. MPLS supports a range of access technologies, including T1/E1, ATM, Frame Relay, and DSL.

Figure 18 shows a simplified version of an MPLS domain. There are routers that exist within the MPLS network or domain, and they communicate with each other via a specific label distribution protocol to set up the LSPs. There are other routers that are outside of the MPLS domain that simply forwards IP traffic like a normal router.

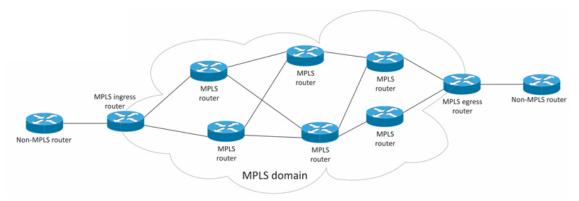

Figure 18: Simplified MPLS Domain Example

To enable the MPLS routing on an Advantech router, install the FRR router app first (see Chapter 2.2). Go to the router app's configuration GUI, select the  $Customization \rightarrow Router Apps \rightarrow FRR \rightarrow Configuration \rightarrow MPLS$  configuration page. Here, enable the MPLS service and choose which interfaces to enable for the MPLS, as shown in Figure 19. You can set the  $Platform \ Labels$  value here as well.

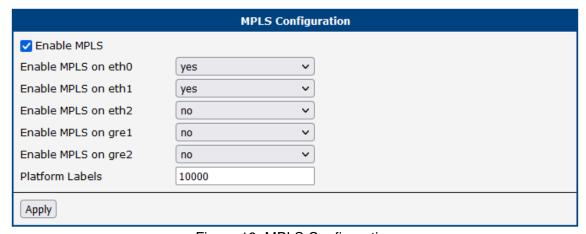

Figure 19: MPLS Configuration

### 5.11 LDP

Label Distribution Protocol (LDP) is a protocol in which routers capable of Multiprotocol Label Switching (MPLS) exchange label mapping information. Two routers with an established session are called LDP peers and the exchange of information is bi-directional. LDP is used to build and maintain LSP databases that are used to forward traffic through MPLS networks. More about this protocol and examples can be found in the FRR online documentation<sup>1</sup>.

```

<sup>1</sup>http://docs.frrouting.org/en/latest/ldpd.html?highlight=ldp

#### 5.12 PIM-SM

PIM-SM (Protocol Independent Multicast – Sparse Mode) protocol is the most commonly used multicast routing protocol that is designed on the assumption that recipients for any particular multicast group will be sparsely distributed throughout the network. In order to receive multicast data, routers must explicitly tell their upstream neighbors about their interest in particular groups. PIM-SM by default uses shared trees, which are multicast distribution trees rooted at some selected node (this router is called the Rendezvous Point, RP) and used by all routers sending to the multicast group.

Config of PIM-SM is bit longer and will be split into 3 parts.

Figure 21: PIM-SM Configuration

Item	Description
RP Address	IP address of Rendezvous Point. This address needs to be the same on all routers in a routing domain. This field may remain empty if RP is selected using BSR (described later).

Table 5: PIM-SM Commands

When device starts sending multicast traffic, router closest to the source (First Hop Router or FHR) will register itself with RP and starts sending the multicast traffic to the RP router. When a client requests multicast traffic, router closest to the client (Last Hop Router or LHR) will request this traffic from RP. RP will then forward all traffic received from FHR to all LHRs that requested it.

There is also a optimization which takes place, where after LHR starts receiving multicast from RP, it may request the traffic directly from FHR, which should help with latency and load on RP.

#### 5.12.1 BSR - BootStrap Router

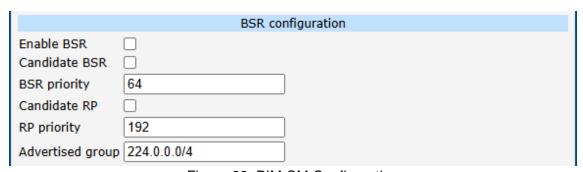

Figure 22: PIM-SM Configuration

BSR is a mechanism using which routers automatically decide which router(s) will become RP. All routers that are candidate BSRs (aka C-BSRs) advertise themselves to other routers. C-BSR with **highest** priority will be elected as a BSR.

When BSR is elected, all candidate RPs (or C-RPs) will advertise themselves to the BSR. BSR will chose a C-RP with **lowest** priority and announce to the rest of the network that this router will be the RP. BSR may chose multiple C-RPs if they advertise different groups. A router can be C-BSR, C-RP or both.

When C-RP advertises itself, it includes for range of multicast groups (specified in Advertised group field) for which the router is willing to act as RP.

BSR then choses subset of C-RPs based on priority and group they advertise.

## 5.12.2 Interface configuration

Interface configuration				
Interface	DR Priority	Passive		
eth0	1	]_		
□ eth1	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
	1	]_		
Use raw config instead				
! Default configuration with enabled vty ! Change password!!!				
* can be blank Apply				

Figure 23: PIM-SM Configuration

First checkbox decides whether interface is included in PIM-SM topology, second field is interface name.

If there are multiple routers connected to the same network segment, like this:

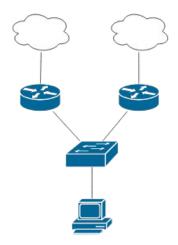

Figure 24: PIM-SM Configuration

All routers will send PIM Hello messages (which routers use to announce themselves and find other routers). Router with highest DR priority will become the Designated Router (DR). Only DR registers multicast source with RP and only DR requests multicast from RP.

However because hello messages are not authenticated, it is sometimes considered a security issue. Mainly because bad actor can send a spoofed PIM hello message causing his computer to be elected as DR. For these situations interface configuration includes "Passive" checkbox.

If interface is configured as passive, it will not send hello or BSR messages to that interface, nor will it process any received hello/BSR messages received on that interface.

- If interface is not enabled and client requests multicast, router will NOT request the multicast from RP, nor will it send hello messages from that interface.
- If interface is enabled and is not passive, router will send hello messages from that interface and if client requests multicast, router will request it from RP.
- If interface is enabled, but it's also passive, router will NOT send hello messages, but if client requests multicast, router will request it from RP.

If "Use raw config instead" is checked, the above configuration will be ignored and configuration from the field bellow it will be used instead.

Example below shows a setup where the RP is manually configured, but the BSR is also enabled. On eth0, PIM is enabled in passive mode, while on eth1, PIM is enabled with a modified DR priority. FRR offers more options, which are described on FRR documentation page.

```
!
router pim
rp 192.0.2.0 224.0.0.0/4
bsr candidate-bsr source any priority 64
bsr candidate-rp source any priority 192
bsr candidate-rp group 224.0.0.0/4
!
interface eth0
ip pim
ip igmp
ip pim passive
!
interface eth1
ip pim
ip igmp
ip igmp
ip igmp
ip igmp
