# Used symbols

 *Danger* – Information regarding user safety or potential damage to the router.

 *Attention* – Problems that can arise in specific situations.

 *Information* – Useful tips or information of special interest.

 *Example* – Example of function, command or script.

# 1. Changelog

This Router App has been tested on a router with firmware version 6.3.10. After updating the router's firmware to a higher version, make sure that a newer version of the Router App has not also been released, as it is necessary to update it as well for compatibility reasons.

## 1.1 Protocol MODBUS TCP2RTU Changelog

### v1.0.0 (2011-07-19)

- First release

### v1.0.1 (2011-11-08)

- Added automatic detection RS485 interface and control of RTS signal for RS485 line

### v1.0.2 (2011-11-25)

- Minor improvements in HTML code

### v1.0.3 (2012-09-19)

- Fixed unhandled exceptions
- Added sending modbus error message 0x0B if reply timeout expire

### v1.0.4 (2013-02-01)

- Added sending modbus error message 0x0B if bad crc is received

### v1.0.5 (2013-05-22)

- Added read out functions of I/O and CNT port

### v1.0.6 (2013-12-11)

- Added support of FW 4.0.0+

### v1.0.7 (2014-04-01)

- Increased size of internal buffer

### v1.0.8 (2014-05-05)

- Added blocking of new clients when connected client is active

### v1.0.9 (2014-11-11)

- Added TCP mode client
- Added serial number and MAC adress into modbus registers

### **v1.1.0 (2015-05-22)**

- Improved requests processing

### **v1.1.1 (2015-06-11)**

- Added test of data length in crc check

### **v1.1.2 (2015-10-14)**

- Disabled signal SIG\_PIPE

### **v1.1.3 (2016-04-25)**

- Enabled keep-alive in TCP server mode

### **v1.2.0 (2016-10-18)**

- Added support of two simultaneously working ports
- Removed unnecessary options

### **v1.2.1 (2016-11-10)**

- Fixed bug in uart read loop

### **v1.3.0 (2017-01-27)**

- Added option Reject new connections
- Added option Inactivity Timeout

### **v1.4.0 (2017-07-10)**

- Added MWAN IPv4 address into MODBUS registers
- Fixed reading of MAC address

### **v1.5.0 (2018-04-23)**

- Added option "None" to serial device selection

### **v1.6.0 (2018-09-27)**

- Added support of ttyUSB
- Fixed file descriptor leaks (in ModulesSDK)

### **v1.6.1 (2018-09-27)**

- Added expected ranges of values to JavaScript error messages

### **v1.7.0 (2020-10-01)**

- Updated CSS and HTML code to match firmware 6.2.0+
- Changed limit for "Reply Timeout" to 1..1000000 ms

### **v1.8.0 (2022-03-03)**

- Added additional values related to MWAN status

### **v1.9.0 (2022-08-12)**

- Added additional device configuration CRC32 value

### **v1.10.0 (2022-11-03)**

- Reworked license information

### **v1.10.1 (2023-02-28)**

- Linked statically with zlib 1.2.13

### **1.11.0 (2023-06-09)**

- Added support for additional binary input and output GPIO pins

### **v1.11.1 (2024-02-16)**

- Added description and summary files
- Recompiled with ModulesSDK 2.1.2

## 2. Description

Router app *Protocol MODBUS TCP2RTU* is not contained in the standard router firmware. Uploading of this router app is described in the Configuration manual (see Chapter [Related Documents](#)).

*Modbus TCP2RTU* router app provides the conversion of MODBUS TCP protocol to MODBUS RTU protocol, which can be used on the serial line. RS232 or RS485/422 interface can be used for serial communication in the Advantech router.

There is a common part PDU For both protocols. MBAP header is used for identification when sending MODBUS ADU to TCP/IP. Port 502 is dedicated for MODBUS TCP ADU.

Figure 1: Modbus message on TCP/IP

When sending a PDU to the serial line, the address of destination unit obtained from a MBAP header as UNIT ID is added to the PDU along with the checksum.

Figure 2: Modbus message on serial line

The module supports configuration of two independent serial interfaces, if available in the router. Automatic recognition of port RS485 from RS422 is supported. Detailed information about the serial interface can be found in the User's manual of the router or Expansion port (RS485/422, see [\[2\]](#)).

# 3. Interface

Web interface is accessible by pressing the module name on the *Router apps* page of the router Web interface.

The left part menu of the Web interface contains these sections: *Status*, *Configuration* and *Customization*. *Status* section contains *Stats* which shows statistical information and *System Log* which shows the same log as in the router's interface. *Configuration* section contains *Port 1*, *Port 2* and *USB* items and *Customization* contains only menu section switches back from the module's web page to the router's web configuration pages. The main menu of module's GUI is shown on Figure 1.

*\* can be blank*

Figure 4: Port Configuration

Meaning of the individual items:

Item	Description
Enable	Enables conversion of MODBUS TCP/IP protocol into MODBUS RTU
Expansion port	Expansion port, where the MODBUS RTU connection will be established. If there is no a MODBUS RTU device connected to the serial interface, it can be set up to "None" and this serial interface can be used for communication with another device. Only internal registers of the router can be read out in this case. For more information see Chapter 5.2.
Baudrate	Applied communication speed

Continued on the next page

Continued from previous page

Item	Description
Parity	Control parity bit: <ul style="list-style-type: none"> <li>• <b>none</b> – No parity will be sent</li> <li>• <b>even</b> – Even parity will be sent</li> <li>• <b>odd</b> – Odd parity will be sent</li> </ul>
Stop Bits	Number of stop bits
Split Timeout	Time for breaking off message (see note below)
TCP Mode	Selection of mode: <ul style="list-style-type: none"> <li>• <b>Server</b> – TCP server</li> <li>• <b>Client</b> – TCP client</li> </ul>
Server Address	Defines server address when selected mode is <i>Client</i> (in <i>TCP Mode</i> item).
TCP Port	TCP port on which the router listens to requests for MODBUS TCP connection. For sending MODBUS ADU is reserved port 502.
Reply Timeout	Specifies the time interval in which it is expecting a response. If the response doesn't receive, it will be sent one of these error codes: <ul style="list-style-type: none"> <li>• <i>0A</i> – Transmission path unavailable <i>Gateway is not able to allocate internal transmission path from the input port to the output port. It is probably overloaded or incorrectly set.</i></li> <li>• <i>0B</i> – The target device doesn't response <i>The target device doesn't response, may not be available.</i></li> </ul>
Inactivity Timeout	Time period after which the TCP/UDP connection is interrupted in case of inactivity
Reject new connections	When enabled, the router rejects any other connection attempts – the router no longer supports multiple connections
Enable I/O and XC-CNT extensions	This option enables direct communication with router. <b>I/O</b> (binary inputs and outputs on the router) and internal registers (mentioned in chapter 5.2) works on all platforms (v2, v2i, v3 and v4). <b>XC-CNT</b> is expansion board for v2 routers. This form of communication works on v2 platform only.
Unit ID	ID for direct communication with router. Values can be 1 to 255. The value 0 is also accepted to communicate directly to a MODBUS/TCP or MODBUS/UDP devices. Default value is 240.

Table 1: Configuration Form

All changes in settings will be applied after pressing the *Apply* button.

**Note:** If a time between the two received characters is recognized to be longer than the *Split Timeout* parameter value in milliseconds, the message from all received data is compiled and then it is sent.

## 4.2 USB Configuration

 Only available for products equipped with USB port.

USB Configuration has nearly the same configuration items as PORT1 and PORT2. Only difference is missing *Enable I/O* and *XC-CNT extensions* and *Unit ID* items.

MODBUS-TCP2RTU USB Configuration	
<input type="checkbox"/>	Enable MODBUS-TCP2RTU protocol on expansion port
Expansion Port	USB
Baudrate	9600
Parity	none
Stop Bits	1
Split Timeout	200 msec
TCP Mode	Server
Server Address	
TCP Port	504
Reply Timeout	1000 msec
Inactivity Timeout *	sec
<input type="checkbox"/>	Reject new connections
* can be blank	
<input type="button" value="Apply"/>

# 5. I/O & XC-CNT MODBUS TCP Server

## 5.1 Basic Characteristic

I/O protocol and XC-CNT MODBUS TCP server is one of the router communication protocol with a *Modbus TCP2RTU* router app based on the I/O interface and XC-CNT expansion boards. Router provides current state of inputs in real time. System can read it using message with 0x03 code (reading values of more registers). Using messages with the code 0x10 (writing values of more registers) system can control digital outputs and set the state counters. Messages with different codes (e.g., 0x6 for writing value of a single register) are not supported.

## 5.2 Address Space of Router

Addresses in the table start from 0. If the implementation uses register numbers starting from 1, the register address needs to be increased by 1.

Address	Access	Description
0x0400	R/-	upper 16 bits of temperature in router [°C] (with sign)
0x0401	R/-	upper 16 bits of temperature in router [°C] (with sign)
0x0402	R/-	upper 16 bits of the supply voltage [mV]
0x0403	R/-	upper 16 bits of the supply voltage [mV]
0x0404	R/-	state of upper 16 bits of BIN2, always 0
0x0405	R/-	state of lower 16 bits of BIN2
0x0406	R/-	state of upper 16 bits of BIN3, always 0
0x0407	R/-	state of lower 16 bits of BIN3
0x0408	R/-	state of upper 16 bits of BIN0, always 0
0x0409	R/-	state of lower 16 bits of BIN0: <ul style="list-style-type: none"><li>• bit 0 – level at the input BIN0</li><li>• bits 1 to 15 – not used, always 0</li></ul>
0x040A	R/-	state of upper 16 bits of BOUT0, always 0
0x040B	R/W	state of lower 16 bits of BOUT0: <ul style="list-style-type: none"><li>• bit 0 – level at the output BOUT0</li><li>• bits 1 to 15 – not used, always 0</li></ul>
0x040C	R/-	state of upper 16 bits of BIN1, always 0
0x040D	R/-	state of lower 16 bits of BIN1: <ul style="list-style-type: none"><li>• bit 0 – level at the input BIN1</li><li>• bits 1 to 15 – not used, always 0</li></ul>
0x040E	R/-	state of upper 16 bits of BOUT1, always 0
0x040F	R/W	state of lower 16 bits of BOUT1: <ul style="list-style-type: none"><li>• bit 0 – level at the output BOUT1</li><li>• bits 1 to 15 – not used, always 0</li></ul>

Table 2: I/O

Address	Access	Description
0x0410	R/-	upper 16 bits of AN1 value, always 0
0x0411	R/-	lower 16 bits of AN1 value, value from 12-bit A-D converter
0x0412	R/-	upper 16 bits of AN2 value, always 0
0x0413	R/-	lower 16 bits of AN2 value, value from 12-bit A-D converter
0x0414	R/W	upper 16 bits of CNT1
0x0415	R/W	lower 16 bits of CNT1
0x0416	R/W	upper 16 bits of CNT2
0x0417	R/W	lower 16 bits of CNT2
0x0418	R/-	state of upper 16 binary inputs: <ul style="list-style-type: none"> <li>• bits 0 to 15 – not used, always 0</li> </ul>
0x0419	R/-	state of lower 16 binary inputs: <ul style="list-style-type: none"> <li>• bit 0 – level at the input BIN1</li> <li>• bit 1 – level at the input BIN2</li> <li>• bit 2 – level at the input BIN3</li> <li>• bit 3 – level at the input BIN4</li> <li>• bits 4 to 15 – not used, always 0</li> </ul>
0x041A	R/-	state of upper 16 binary outputs: <ul style="list-style-type: none"> <li>• bits 0 to 15 – not used, always 0</li> </ul>
0x041B	R/W	state of lower 16 binary outputs: <ul style="list-style-type: none"> <li>• bit 0 – level at the output BOUT1</li> <li>• bits 1 to 15 – not used, always 0</li> </ul>
0x041C	R/-	not used, always 0
0x041D	R/-	not used, always 0
0x041E	R/-	not used, always 0
0x041F	R/-	not used, always 0

Table 3: XC-CNT – PORT1

Address	Access	Description
0x0420	R/-	upper 16 bits of AN1 value, always 0
0x0421	R/-	lower 16 bits of AN1 value, value from 12-bit A-D converter
0x0422	R/-	upper 16 bits of AN2 value, always 0
0x0423	R/-	lower 16 bits of AN2 value, value from 12-bit A-D converter
0x0424	R/W	upper 16 bits of CNT1
0x0425	R/W	lower 16 bits of CNT1
0x0426	R/W	upper 16 bits of CNT2
0x0427	R/W	lower 16 bits of CNT2
0x0428	R/-	state of upper 16 binary inputs: • bits 0 to 15 – not used, always 0
0x0429	R/-	state of lower 16 binary inputs: • bit 0 – level at the input BIN1 • bit 1 – level at the input BIN2 • bit 2 – level at the input BIN3 • bit 3 – level at the input BIN4 • bits 4 to 15 – not used, always 0
0x042A	R/-	state of upper 16 binary outputs: • bits 0 to 15 – not used, always 0
0x042B	R/W	state of lower 16 binary outputs: • bit 0 – level at the output BOUT1 • bits 1 to 15 – not used, always 0
0x042C	R/-	not used, always 0
0x042D	R/-	not used, always 0
0x042E	R/-	not used, always 0
0x042F	R/-	not used, always 0

Table 4: XC-CNT – PORT2

Address	Access	Description
0x0430	R/-	upper 16 bits of serial number
0x0431	R/-	lower 16 bits of serial number
0x0432	R/-	1 <sup>st</sup> and 2 <sup>nd</sup> byte of MAC address
0x0433	R/-	3 <sup>rd</sup> and 4 <sup>th</sup> byte of MAC address
0x0434	R/-	5 <sup>th</sup> and 6 <sup>th</sup> byte of MAC address
0x0435	R/-	1 <sup>st</sup> and 2 <sup>nd</sup> byte of IP address MWAN
0x0436	R/-	3 <sup>rd</sup> and 4 <sup>th</sup> byte of IP address MWAN
0x0437	R/-	number of active SIM
0x0438	R/-	1 <sup>st</sup> and 2 <sup>nd</sup> byte of MWAN Rx Data

0x044A	R/-	MWAN TAC
0x044B	R/-	MWAN Channel
0x044C	R/-	MWAN Band
0x044D	R/-	MWAN Signal Strength
0x044E	R/-	CRC32 value of router configuration
0x044F	R/-	CRC32 value of router configuration

Table 5: Other Information

**Notes:**

- Serial number on addresses 0x0430 and 0x0431 are present only in case of 7 digit serial number, otherwise are values on those addresses empty.
- In case of absence XC-CNT board all corresponding values are 0.
- Information about the current fitting and configuration of XC-CNT boards can be found in the system log after starting the router app.
- Writing is in fact possible to all registers. Writing to the registry, which is not designed for writing, is always successful, however there is no physically change.
- Reading values from register address range 0x0437 - 0x044D works on all router platforms.
