1. IPsec and its Protocols

IPsec (Internet Protocol Security) is a security extension of IP protocol based on authentication and encryption of every IP datagram. Within the OSI architecture, it is security at the network layer, which means that IPsec provides security for any transfer (any network application).

IPsec pay attention to these major security issues:

- **Authenticating** – Allows to verify the origin of the data, so if a packet is received, it is possible to verify that the transmitted packet corresponds to the sender or whether the sender exists at all (Phase I, IKE phase, Main mode). At PSK ends with key exchange.
- **Encrypting** – Both of sides agree on the form of packet encryption in advance. Thereafter the entire packet apart from the IP header will be encrypted, alternatively the entire packet will be encrypted and a new IP header will be added (Phase II, IPsec phase, Quick mode). Ends with establishing of a tunnel.

IPsec consists of two basic protocols – *Authentication Header (AH)* and *Encapsulating Security Payload (ESP)*. AH protocol is not supported in router's Web interface configuration. Both protocols together are often unsupported by some gateways on the way in the Internet.

Part of IPsec is also *IKE (Internet Key Exchange)* protocol (key management). IKE creates logical channels which are called *Security Associations (SA)*. These channels are always unidirectional therefore it is necessary to use two separate channels (SA) for duplex. IKE also supports automatic generation and recovery of encryption keys.

1.1 Encapsulating Security Payload (ESP)

Encapsulating Security Payload (ESP) protocol ensures the confidentiality of transmitted data (encrypts packets) and optionally the original authentication, data integrity and protection against reverse queries. As with the Authentication Header (AH) protocol, additional header is attached to an IP packet. This header contains the security parameters which are followed by encrypted data. However, the outer header is not protected and its integrity is not guaranteed.

In case of requirement for encryption and authentication, system which responds first authenticates packet and if the first step is successful, continues with encryption. This type of configuration reduces both overhead of processing and vulnerability in case of attack when denial of service.

1.1.1 Usage of Encapsulating Security Payload protocol

ESP protocol can be used in two ways – in *transport mode* or in *tunnel mode*. Transport mode inserts ESP header behind the IP header of the original IP datagram. ESP trailer and optional authentication data follow data of the original datagram. Transport mode requires less overhead when processing than the tunnel mode, but does not provide such security of data protection.

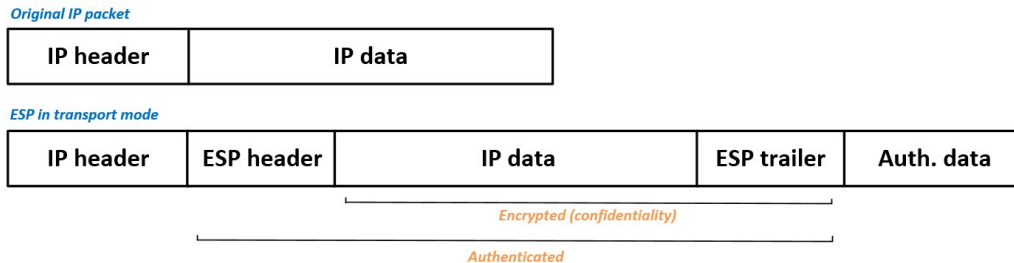

Figure 1: ESP – transport mode

Tunnel mode (sometimes tunneling mode) creates a new IP header which is followed by header of Encapsulating Security Payload protocol. This is followed by the entire original datagram packaged as new data datagram. This allows to completely protect original datagram (in case that encryption and authentication are used). ESP trailer and optional authentication data follow data of the original datagram.

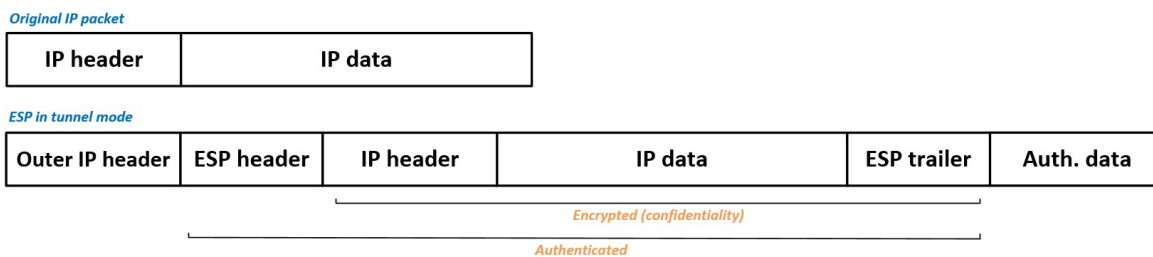

Figure 2: ESP – tunnel mode

2. Configuration of IPsec Tunnel

The IPsec tunnel function allows you to create a secured connection between two separate LAN networks. Advantech routers allows you to create **up to four IPsec tunnels**.

To open the IPsec tunnel configuration page, click *IPsec* in the *Configuration* section of the main menu. The menu item will expand and you will see four separate configuration pages: *1st Tunnel*, *2nd Tunnel*, *3rd Tunnel* and *4th Tunnel*. Supported are both, **policy-based** and **route-based** VPN approaches, see the different configuration scenarios in Chapter 2.1.

IPv4 and IPv6 tunnels are supported (**dual stack**), you can transport IPv6 traffic through IPv4 tunnel and vice versa. For different IPsec authentication scenarios, see Chapter 2.2.

 The dual stack IPsec tunnels are not supported by routers of v2 product line.

 **FRRouting (FRR)** router app is an Internet routing protocol suite for Advantech routers. This UM includes protocol daemons for BGP, IS-IS, LDP, OSPF, PIM, and RIP.

To encrypt data between the local and remote subnets, specify the appropriate values in the subnet fields on both routers. To encrypt the data stream between the routers only, leave the local and remote subnets fields blank.

If you specify the protocol and port information in the *Local Protocol/Port* field, then the router encapsulates only the packets matching the settings.

For optimal an secure setup, we recommend to follow instructions on the [Security Recommendations strongSwan](#) web page.

2.1 Route-based Configuration Scenarios

There are more different route-based configuration options which can be configured and used in Advantech routers. Below are listed the most common cases which can be used (for more details see [Route-based VPNs strongSwan](#) web page):

1. Enabled Installing Routes

- Remote (local) subnets are used as traffic selectors (routes).
- It results to the same outcome as a policy-based VPN.
- One benefit of this approach is the possibility to verify non-encrypted traffic passed through an IPsec tunnel number X by `tcdump` tool: `tcdump -i ipsecX`.
- Set up the *Install Routes* to *yes* option.

2. Static Routes

- Routes are installed statically by an application as soon as the IPsec tunnel is up.
- As an application for static routes installation can be used for example FRR/STATICD application.
- Set up the *Install Routes* to *no* option.

3. Dynamic Routing

- Routes are installed dynamically while running by an application using a dynamic protocol.
- As an application for dynamic routes installation can be used for example FRR/BGP or FRR/OSPF application. This application gains the routes dynamically from an (BGP, OSPF) server.
- Set up the *Install Routes* to *no* option.

4. Multiple Clients

- Allows to create VPN network with multiple clients. One Advantech router acts as the server and assigns IP address to all the clients on the network.
- The server has *Remote Virtual Network* and *Remote Virtual Mask* items configured and the client has *Local Virtual Address* item configured.
- Set up the *Install Routes* to *yes* option.

2.2 IPsec Authentication Scenarios

There are four basic authentication options which can be configured and used in Advantech routers:

1. Pre-shared Key

- Set *Authenticate Mode* to *pre-shared key* option.
- Enter the shared key to the *Pre-shared key* field.

2. Public Key

- Set *Authenticate Mode* to *X.509 certificate* option.
- Enter the public key to the *Local Certificate / PubKey* field.
- CA certificate is not required.

3. Peer Certificate

- Set *Authenticate Mode* to *X.509 certificate* option.
- Enter the remote key to the *Remote Certificate / PubKey* field. Users with this certificate will be allowed.
- CA certificate is not required.

4. CA Certificate

- Set *Authenticate Mode* to *X.509 certificate* option.
- Enter the CA certificate or a list of CA certificates to the *CA Certificate* field. Any certificate signed by the CA will be accepted.
- Remote certificate is not required.

Notes:

- The Peer and CA Certificate (options 3 and 4) can be configured and used simultaneously – authentication can be done by one of this method.
- The Local ID is significant. When using certificate authentication, the IKE identity must be contained in the certificate, either as *subject* or as *subjectAltName*.

2.3 Configuration Items Description

The configuration GUI for IPsec is shown in Figure 3 and the description of all items, which can be configured for an IPsec tunnel, are described in Table ??.

1st IPsec Tunnel Configuration

Figure 3: IPsec Tunnels Configuration

Item	Description
Description	Name or description of the tunnel.
Type	<ul style="list-style-type: none"> • policy-based – Choose for the policy-based VPN approach. • route-based – Choose for the route-based VPN approach. Note: Data throughput via route-based VPN is slightly lower in comparison with policy-based VPN.
Host IP Mode	<ul style="list-style-type: none"> • IPv4 – The router communicates via IPv4 with the opposite side of the tunnel. • IPv6 – The router communicates via IPv6 with the opposite side of the tunnel.
Remote IP Address	IPv4, IPv6 address or domain name of the remote side of the tunnel, based on selected <i>Host IP Mode</i> above.
Tunnel IP Mode	<ul style="list-style-type: none"> • IPv4 – The IPv4 communication runs inside the tunnel. • IPv6 – The IPv6 communication runs inside the tunnel.
Remote ID	Identifier (ID) of remote side of the tunnel. It consists of two parts: a <i>hostname</i> and a <i>domain-name</i> .
Local ID	Identifier (ID) of local side of the tunnel. It consists of two parts: a <i>hostname</i> and a <i>domain-name</i> .
Install Routers	For route-based type only. Choose yes to use traffic selectors as route(s).
First Remote Subnet	IPv4 or IPv6 address of a network behind remote side of the tunnel, based on <i>Tunnel IP Mode</i> above.
First Remote Subnet Mask/Prefix	IPv4 subnet mask of a network behind remote side of the tunnel, or IPv6 prefix (single number 0 to 128).
Second Remote Subnet	IPv4 or IPv6 address of the second network behind remote side of the tunnel, based on <i>Tunnel IP Mode</i> above. For <i>IKE Protocol = IKEv2</i> only.
Second Remote Subnet Mask/Prefix	IPv4 subnet mask of the second network behind remote side of the tunnel, or IPv6 prefix (single number 0 to 128). For <i>IKE Protocol = IKEv2</i> only.
Remote Protocol/Port	Specifies Protocol/Port of remote side of the tunnel. The general form is <i>protocol/port</i> , for example 17/1701 for UDP (protocol 17) and port 1701. It is also possible to enter only the number of protocol, however, the above mentioned format is preferred.
First Local Subnet	IPv4 or IPv6 address of a local network, based on <i>Tunnel IP Mode</i> above.
First Local Subnet Mask/Prefix	IPv4 subnet mask of a local network, or IPv6 prefix (single number 0 to 128).
Second Local Subnet	IPv4 or IPv6 address of the second local network, based on <i>Tunnel IP Mode</i> above. For <i>IKE Protocol = IKEv2</i> only.
Second Local Subnet Mask/Prefix	IPv4 subnet mask of the second local network, or IPv6 prefix (single number 0 to 128). For <i>IKE Protocol = IKEv2</i> only.
Local Protocol/Port	Specifies Protocol/Port of a local network. The general form is <i>protocol/port</i> , for example 17/1701 for UDP (protocol 17) and port 1701. It is also possible to enter only the number of protocol, however, the above mentioned format is preferred.
Remote Virtual Network	Specifies virtual remote network for server (responder).
Remote Virtual Mask	Specifies virtual remote network mask for server (responder).

Continued on the next page

Continued from previous page

Item	Description
Local Virtual Address	Specifies virtual local network address for client. To get address from server set up the address to 0.0.0.0.
Encapsulation Mode	Specifies the IPsec mode, according to the method of encapsulation. <ul style="list-style-type: none"> • tunnel – entire IP datagram is encapsulated. • transport – only IP header is encapsulated. Not supported by route-based VPN. • beet – the ESP packet is formatted as a transport mode packet, but the semantics of the connection are the same as for tunnel mode.
Force NAT Traversal	Enable NAT traversal enforcement (UDP encapsulation of ESP packets).
IKE Protocol	Specifies the version of IKE (IKEv1/IKEv2 , IKEv1 or IKEv2).
IKE Mode	Specifies the mode for establishing a connection (<i>main</i> or <i>aggressive</i>). If you select the aggressive mode, then the router establishes the IPsec tunnel faster, but the encryption is permanently set to 3DES-MD5. We recommend that you not use the aggressive mode due to lower security!
IKE Algorithm	Specifies the means by which the router selects the algorithm: <ul style="list-style-type: none"> • auto – The encryption and hash algorithm are selected automatically. • manual – The encryption and hash algorithm are defined by the user.
IKE Encryption	Encryption algorithm – 3DES , AES128 , AES192 , AES256 , AES128GCM128 , AES192GCM128 , AES256GCM128 .
IKE Hash	Hash algorithm – MD5 , SHA1 , SHA256 , SHA384 or SHA512 .
IKE DH Group	Specifies the Diffie-Hellman groups which determine the strength of the key used in the key exchange process. Higher group numbers are more secure, but require more time to compute the key.
IKE Reauthentication	Enable or disable IKE reauthentication (for IKEv2 only).
XAUTH Enabled	Enable extended authentication (for IKEv1 only).
XAUTH Mode	Select XAUTH mode (client or server).
XAUTH Username	XAUTH username.
XAUTH Password	XAUTH password.
ESP Algorithm	Specifies the means by which the router selects the algorithm: <ul style="list-style-type: none"> • auto – The encryption and hash algorithm are selected automatically. • manual – The encryption and hash algorithm are defined by the user.
ESP Encryption	Encryption algorithm – 3DES , AES128 , AES192 , AES256 , AES128GCM128 , AES192GCM128 , AES256GCM128 .
ESP Hash	Hash algorithm – MD5 , SHA1 , SHA256 , SHA384 or SHA512 .
PFS	Enables/disables the <i>Perfect Forward Secrecy</i> function. The function ensures that derived session keys are not compromised if one of the private keys is compromised in the future.
PFS DH Group	Specifies the Diffie-Hellman group number (see <i>IKE DH Group</i>).
Key Lifetime	Lifetime key data part of tunnel. The minimum value of this parameter is 60 s. The maximum value is 86400 s.
IKE Lifetime	Lifetime key service part of tunnel. The minimum value of this parameter is 60 s. The maximum value is 86400 s.

Continued on the next page

Continued from previous page

Item	Description
Rekey Margin	Specifies how long before a connection expires that the router attempts to negotiate a replacement. Specify a maximum value that is less than half of IKE and Key Lifetime parameters.
Rekey Fuzz	Percentage of time for the Rekey Margin extension.
DPD Delay	Time after which the IPsec tunnel functionality is tested.
DPD Timeout	The period during which device waits for a response.
Authenticate Mode	Specifies the means by which the router authenticates: <ul style="list-style-type: none"> • Pre-shared key – Sets the shared key for both sides of the tunnel. • X.509 Certificate – Allows X.509 authentication in multiclient mode.
Pre-shared Key	Specifies the shared key for both sides of the tunnel. The prerequisite for entering a key is that you select pre-shared key as the authentication mode.
CA Certificate	Certificate for X.509 authentication.
Remote Certificate \ PubKey	Certificate for X.509 authentication or PubKey for public key signature authentication.
Local Certificate \ PubKey	Certificate for X.509 authentication or PubKey for public key signature authentication.
Local Private Key	Private key for X.509 authentication.
Local Passphrase	Passphrase used during private key generation.
Debug	Choose the level of logging verbosity from: silent , audit , control (default), control-more , raw , private (most verbose including the private keys). See Logger Configuration in <i>strongSwan</i> web page for more details.

Table 1: IPsec Tunnel Configuration

We recommend that you keep up the default settings. When you set key exchange times higher, the tunnel produces lower operating costs, but the setting also provides less security. Conversely, when you reducing the time, the tunnel produces higher operating costs, but provides for higher security. The changes in settings will apply after clicking the *Apply* button.

Do not miss:

- If local and remote subnets are not configured then only packets between local and remote IP address are encapsulated, so only communication between two routers is encrypted.
- If protocol/port fields are configured then only packets matching these settings are encapsulated.

2.4 Certificate Generation

The following procedure describes how to generate certificates and keys without a password phrase:

```

***** certification authority *****
openssl rand -out private/.rand 1024
openssl genrsa -des3 -out private/ca.key 2048
openssl req -new -key private/ca.key -out tmp/myrootca.req
openssl x509 -req -days 7305 -sha1 -extensions v3_ca -signkey
private/ca.key -in tmp/myrootca.req -out ca.crt

***** server cert *****
openssl genrsa -out private/server.key 2048
openssl req -new -key private/server.key -out tmp/server.req
openssl x509 -req -days 7305 -sha1 -extensions v3_req -CA ca.crt -CAkey
private/ca.key -in tmp/server.req -CAserial ca.srl -CAcreateserial
-out server.crt

***** client cert *****
openssl genrsa -out private/client.key 2048
openssl req -new -key private/client.key -out tmp/client.req
openssl x509 -req -days 7305 -sha1 -extensions v3_req -CA ca.crt -CAkey
private/ca.key -in tmp/client.req -CAserial ca.srl -CAcreateserial
-out client.crt

```

Listed below are the certificates with password phrase "router" (certification authority remains unchanged):

```

***** server cert *****
openssl genrsa -des3 -passout pass:router -out private/server.pem 2048
openssl req -new -key private/server.pem -out tmp/server.req
openssl x509 -req -days 7305 -sha1 -extensions v3_req -CA ca.crt -CAkey
private/ca.key -in tmp/server.req -CAserial ca.srl -CAcreateserial
-out server.crt

***** client cert *****
openssl genrsa -des3 -passout pass:router -out private/client.pem 2048
openssl req -new -key private/client.pem -out tmp/client.req
openssl x509 -req -days 7305 -sha1 -extensions v3_req -CA ca.crt -CAkey
private/ca.key -in tmp/client.req -CAserial ca.srl -CAcreateserial
-out client.crt

```

The IPsec function supports the following types of identifiers (ID) for both sides of the tunnel, *Remote ID* and *Local ID* parameters:

- IP address (for example, 192.168.1.1)
- DN (for example, C=CZ,O=CompanyName,OU=TP,CN=A)
- FQDN (for example, @director.companyname.cz) – **the @ symbol proceeds the FQDN.**
- User FQDN (for example, director@companyname.cz)

The certificates and private keys have to be in the PEM format. Use only certificates containing start and stop tags.

The random time, after which the router re-exchanges new keys is defined as follows:

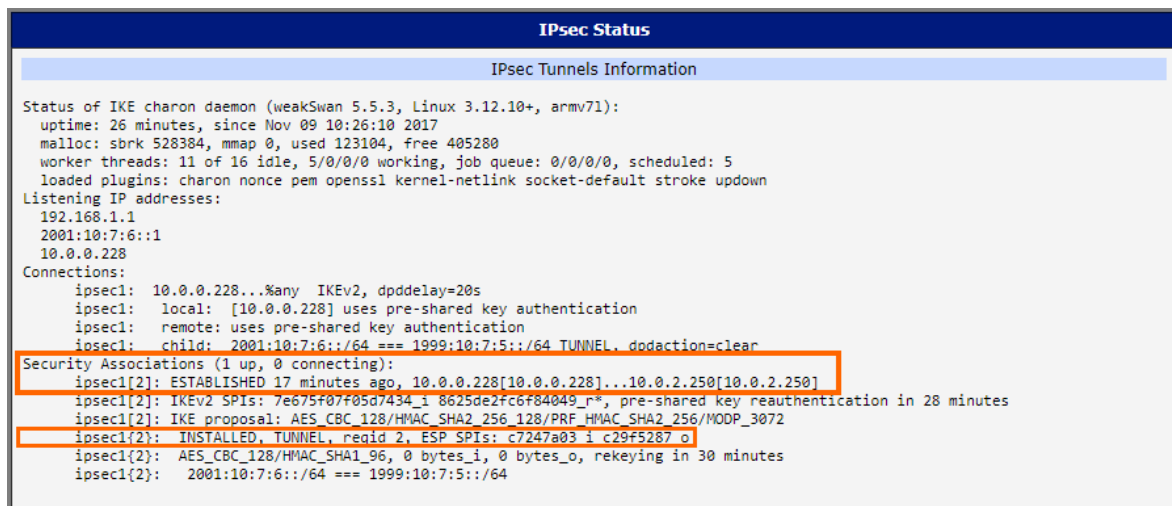

Lifetime - (Rekey margin + random value in range (from 0 to Rekey margin * Rekey Fuzz/100))

The default exchange of keys is in the following time range:

- Minimal time: 1h - (9m + 9m) = 42m
- Maximal time: 1h - (9m + 0m) = 51m

2.5 IPsec Status – Tunnel Established

Selecting the *IPsec* option in the *Status* menu of the web page will bring up the information for any IPsec Tunnels that have been established. If the tunnel has been built correctly, the screen will display **ESTABLISHED** and the number of running IPsec connections **1 up** (orange highlighted in the figure below.) If there is no such text in log (e.g. "0 up"), the tunnel was not created!

```
IPsec Status

Figure 4: IPsec Status

3. Examples of Use

3.1 IPv6 IPsec Tunnel over IPv4 Internet

Figure 5: IPv6 IPsec tunnel over IPv4 Internet – two Advantech routers

This is an example of IPsec tunnel establishment for IPv6 network. Two Advantech v3 Routers are used (IPv6 is supported on v3 routers). One Advantech router as IPsec initiator and one Advantech router as IPsec responder. The routers are connected to the Internet via IPv4 but the communication inside established IPsec tunnel is IPv6, so the IPv6 networks on both sides can be connected to each other. See the configuration forms and IPsec Status pages on the following figures.

```

Figure 9: IPsec Status of the Responder

3.2 Advantech Router and Cisco Basic IPsec Tunnel Configurations

There is a bug in Cisco ASA 5500-X Series Firewalls. IKEv2 between ASA and strongswan (IKEv2 aes256/sha256) does not work. More info at <https://quickview.cloudapps.cisco.com/quickview/bug/CSCvb21927>.

3.2.1 IKEv1 Pre-shared key Tunnel

IP address of the SIM card inserted into Advantech router can be either static or dynamic, because IPsec tunnel is established by initiator on the router. In this case, Linux server (Cisco router) offers services for IPsec tunnel therefore it has to be always available on a static IP address or on a domain name.

Figure 10: IPsec tunnel – initiator on the router

If addresses of tunnel ends are visible to one another, all you have to do is specify these items: *Description*, *Remote IP address*, *First Remote Subnet*, *First Remote Subnet Mask*, *First Local Subnet* and *First Local Subnet Mask*. If not (one end of the tunnel is in a private network), it is necessary to set *Force NAT Traversal* to *yes*.

If *NAT Traversal* is active, it is also necessary to set *Remote ID*. The FQDN (Fully Qualified Domain Name) has to be provided as the Remote ID, which is the designation for a fully specified domain name of the computer. It is also possible to set authentication using certificates, but then there is no need to enter *Remote ID*.

The following table provides an example of IPsec tunnel settings which correspond to the Figure from the beginning of this chapter:

Item	Value
Remote IP Address	83.208.155.127
Remote ID	ciscoasa@default.domain
First Remote Subnet	192.168.1.0
First Remote Subnet Mask	255.255.255.0
First Local Subnet	192.168.3.0
First Local Subnet Mask	255.255.255.0
Force NAT Traversal	yes
Pre-shared Key	test

Table 2: IPsec tunnel settings (initiator)

Other parameters can be left in default settings. If the *Remote IP Address* parameter is empty on one side of the IPsec tunnel, then this side will wait for a connection and will not attempt to establish a connection.

All items that are not mentioned in the sample settings and are marked with an asterisk (*) may not be filled in. They are used to accurate identification of the tunnel.

The screenshot shows the '1st IPsec Tunnel Configuration' page. It includes a checkbox for 'Create 1st IPsec tunnel' which is checked. Below this are several input fields and dropdown menus for configuring the tunnel. The fields are as follows:

- Description *: my tunnel
- Remote IP Address *: 83.208.155.127
- Remote ID *: ciscoasa@default.domain
- First Remote Subnet *: 192.168.1.0
- First Remote Subnet Mask *: 255.255.255.0
- Second Remote Subnet *: (empty)
- Second Remote Subnet Mask *: (empty)
- Remote Protocol/Port *: (empty)
- Local ID *: (empty)
- First Local Subnet *: 192.168.3.0
- First Local Subnet Mask *: 255.255.255.0
- Second Local Subnet *: (empty)
- Second Local Subnet Mask *: (empty)
- Local Protocol/Port *: (empty)
- Encapsulation Mode: tunnel (dropdown)
- Force NAT Traversal: yes (dropdown)
- Authenticate Mode: pre-shared key (dropdown)
- Pre-shared Key: test

Figure 11: IPsec tunnel – example configuration of initiator on the router

Information about the active IPsec tunnel can be found in the *Status* section on the *IPsec* page of the router web interface.

Advantech Router as IPsec Responder

Advantech router must have an available static IP address or dynamic IP address of the SIM card in case of using translation of dynamically assigned IP addresses to DynDNS domain name. In this case, Linux server (Cisco router) is initiator and establishes IPsec tunnel.

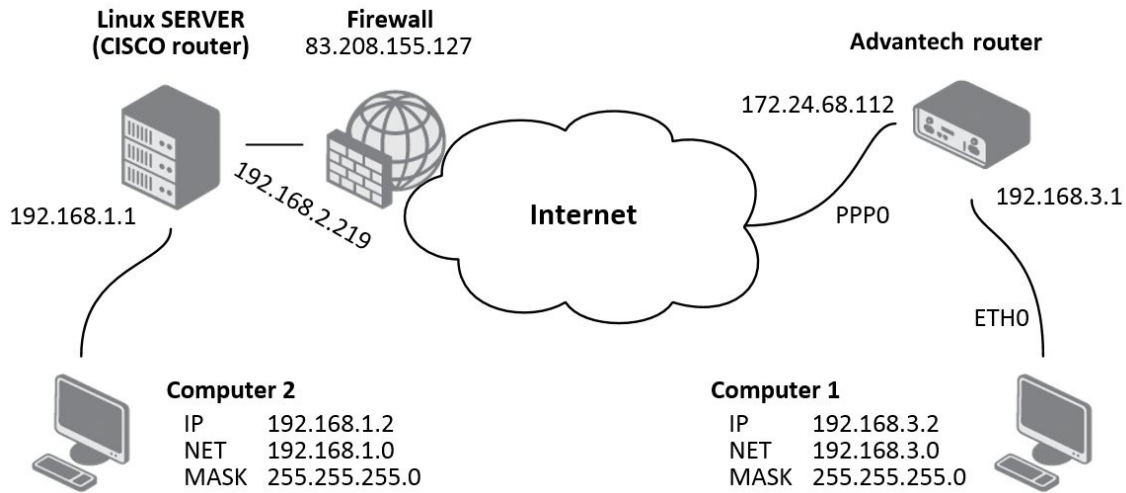

Figure 12: IPsec tunnel – responder on the router

If addresses of tunnel ends are visible to one another, all you have to do is specify these items: *Description*, *First Remote Subnet* and *First Remote Subnet Mask*. If not (one end of the tunnel is in a private network), it is necessary to set *Force NAT Traversal* to *yes*.

If *Force NAT Traversal* is active, it is also necessary to set *Remote ID*. As the ID has to be filled FQDN (Fully Qualified Domain Name), which is the designation for a fully specified domain name of the computer. It is also possible to set authentication using certificates, but then there is no need to enter *Remote ID*.

The following table provides an example of IPsec tunnel settings which correspond to the figure from the beginning of this page:

Item	Value
Remote ID	ciscoasa@default.domain
First Remote Subnet	192.168.2.219
First Remote Subnet Mask	255.255.255.255
Force NAT Traversal	yes
Pre-shared Key	test

Table 3: IPsec tunnel settings (responder)

Other parameters can be left in default settings. If the *Remote IP Address* parameter is empty on one side of IPsec tunnel, then this side will wait for a connection and will not attempt to establish a connection.

All items that are not mentioned in the sample settings and are marked with an asterisk (*) may not be filled in. They are used to accurate identification of the tunnel.

The screenshot displays the '1st IPsec Tunnel Configuration' page. It features a list of configuration options, many of which are marked with an asterisk (*). The 'Create 1st IPsec tunnel' checkbox is checked. The 'Description' field is filled with 'my tunnel'. The 'Remote ID' field contains 'ciscoasa@default.domain'. The 'First Remote Subnet' is '192.168.2.219' and the 'First Remote Subnet Mask' is '255.255.255.255'. The 'Encapsulation Mode' is set to 'tunnel' and 'Force NAT Traversal' is set to 'yes'. The 'Authenticate Mode' is 'pre-shared key' and the 'Pre-shared Key' is 'test'. Several fields, including 'Remote IP Address', 'Second Remote Subnet', 'Second Remote Subnet Mask', 'Remote Protocol/Port', 'Local ID', 'First Local Subnet', 'First Local Subnet Mask', 'Second Local Subnet', and 'Second Local Subnet Mask', are empty and marked with an asterisk. A vertical ellipsis of three orange dots is visible between the main configuration section and the authentication section.

1st IPsec Tunnel Configuration	
<input checked="" type="checkbox"/> Create 1st IPsec tunnel	
Description *	my tunnel

Pre-shared Key	test

Figure 13: IPsec tunnel – example configuration of responder on the router

Information about the active IPsec tunnel can be found in the *Status* section on the *IPsec* page of the router web interface.

Linux Server IPsec Configuration

Figure 14: IPsec tunnel – Linux server

On the Linux server is needed to configure *ipsec.conf* and *ipsec.secrets* files. Configuration of *ipsec.conf* file can be performed for example like this:

```
conn advantechrouter
  authby=secret
  type=tunnel
  left=83.208.155.127
  leftsubnet=192.168.1.0/24
  right=172.24.68.112
  rightsubnet=192.168.3.0/24
  ikelifetime=3600s
  keylife=3600s
  pfs=no
  auto=add
```

ipsec.secrets file shall be configured as follows:

```
83.208.155.127 172.24.68.112: PSK "test"
```

Cisco Router as Initiator – IPsec Configuration

Please note that Cisco routers support IPsec protocol since IOS version no. 7.1.

3.2.2 Certificate Generation

This chapter is an example showing how to generate the certificates on a Linux or Windows based machine.

1. CA - ca.key, ca.csr, ca.crt

- `mkdir certs; cd certs; touch index.txt`
- `import openssl.conf`
- private key:
`openssl genrsa -des3 -out ca.key 2048`
- certificate signing request:
`openssl req -verbose -new -key ca.key -out ca.csr -sha256`
- self-sign CA certificate (see Appendix [A] for example of *openssl.conf*):
`openssl ca -create_serial -extensions v3_ca -config ./openssl.conf -out ca.crt
-keyfile ca.key -verbose -selfsign -md sha256 -enddate 301231235959Z
-infiles ca.csr`
- check CA certificate:
`openssl x509 -noout -text -in ca.crt`

2. Server cisco cert - server_cisco.key, server_cisco.csr, server_cisco.crt

- private key:
`openssl genrsa -des3 -out server_cisco.key 2048`
- certificate signing request: (see Appendix [B] for example of *server_req.conf*)
`openssl req -verbose -new -key server_cisco.key -out server_cisco.csr
-config server_req.conf`
- self-sign server_cisco certificate:
`openssl ca -config ./server_req.conf -extensions v3_req -enddate
301231235959Z -out server_cisco.crt -keyfile ca.key -infiles server_cisco.csr`
- check server_cisco certificate:
`openssl x509 -noout -text -in server_cisco.crt`

3. Client router cert - client_router.key, client_router.csr, client_router.crt

- private key:
`openssl genrsa -des3 -out client_router.key 2048`
- certificate signing request: (see Appendix [C] for example of *client_req.conf*)
`openssl req -verbose -new -key client_router.key -out client_router.csr
-config client_req.conf`
- self-sign server_cisco certificate:
`openssl ca -config ./client_req.conf -extensions v3_req -enddate 301231235959Z -out
client_router.crt -keyfile ca.key -infiles client_router.csr`
- check client_router certificate:
`openssl x509 -noout -text -in client_router.crt`

4. Verify if certs/keys are really corectly generated - they have to match.

- `openssl x509 -noout -modulus -in [client_router/server_cisco].cert | openssl md5`
- `openssl rsa -noout -modulus -in [client_router/server_cisco].key | openssl md5`
- hashes have to be equal

3.2.3 How to Import Certificates to Cisco

This chapter is an example showing how to import ca, server key and server certificates to a Cisco device.

1. configure terminal

2. `crypto pki trustpoint server.ciso`

```
no revocation-check
enrollment terminal pem
exit
```

3. `crypto pki import server.ciso pem terminal password <password>`

```
paste ca certificate in PEM format
paste encrypted private server key in PEM format
paste server certificate in PEM format
exit
```

4. `crypto pki certificate map ike_v2_certmap 10`

```
subject-name co client
```

5. `show crypto pki trustpoint server.ciso status`

```
Trustpoint server.ciso:
Issuing CA certificate configured:
  Subject Name:
    e=advantech@advantech.com,cn=www.advantech.com,ou=Advantech CZ,o=Advantech,
    st=Czechia,c=CZ

  Fingerprint MD5: 20514117 B5B696F5 00375153 A9DC864C
  Fingerprint SHA1: 532AA251 EB16DAEC 89BB97C4 DDE0D3E3 F7A07270
Router General Purpose certificate configured:
  Subject Name:
    cn=server@cisco,ou=Advantech CZ,o=Advantech,st=Czechia,c=CZ
  Fingerprint MD5: 1712292C A41F36FE 56F12682 1A503577
  Fingerprint SHA1: 01C99D4C 4064AFF6 123421A1 5A9F23BB 8DEA2D60
State:
  Keys generated ..... Yes (General Purpose, non-exportable)
  Issuing CA authenticated ..... Yes
  Certificate request(s) ..... Yes
```

Note: If cisco is configured by copy/paste raw config via terminal then private keys are not imported (only ca and cert is imported). In this case you can use these cmd to import private key:

1. `crypto key import rsa <name> terminal <password>`

2. `crypto pki trustpoint <name>`
`rsakeypair <name>`

3.2.4 IKEv1 Certificate-based Tunnel

This chapter describes how to set up an IKEv1 certificate-based tunnel between the Cisco device and the Advantech router. The Cisco device acts as the server and the Advantech router as the client. See chapter 3.2.2 for demonstration of certificate generation and chapter 3.2.3 to see how to import it.

Setup of Cisco

1. configure terminal
2. crypto pki certificate map ikev1_map 10

 subject-name co client
3. crypto isakmp policy 10

 encr aes 256
 hash sha256
 group 14
4. crypto isakmp identity dn (identity is DN of server.cisco certificate)
5. crypto isakmp profile ikev1

 ca trust-point server.cisco
 match certificate ikev1_map
 local-address <IP address>

6. crypto map ike_v1_map 10 ipsec-isakmp

```
set peer <IP address>
set transform-set aaset (esp algs and mode is the same as for ikev2)
set isakmp-profile ikev1
match address ike_v2_acl (traffic selector is the same as for ikev2)
```

7. interface GigabitEthernet0

```
ip address <IP address> <mask>
duplex auto
speed auto
no keepalive
crypto map ike_v1_map
```

8. exit

9. show crypto isakmp sa detail

```
Codes: C - IKE configuration mode, D - Dead Peer Detection
K - Keepalives, N - NAT-traversal

3.2.5 IKEv2 Certificate-based Tunnel

This chapter describes how to set up an IKEv2 certificate-based tunnel between the Cisco device and the Advantech router. The Cisco device acts as the server and the Advantech router as the client. See chapter 3.2.2 for demonstration of certificate generation and chapter 3.2.3 to see how to import it.

Setup of Cisco

1. configure terminal

2. crypto ikev2 authorization policy ike_v2_policy

```
crypto ikev2 proposal ike_v2_proposal
encryption aes-cbc-256
integrity sha256
group 14
```

3. crypto ikev2 policy ike_v2_policy

```
proposal ike_v2_proposal
crypto ikev2 profile ike_v2_profile
match certificate ike_v2_certmap
identity local [ fqdn server.cisco | email server@cisco | address XX.XX.XX.XX ]
authentication remote rsa-sig
authentication local rsa-sig
pki trustpoint server.cisco
```

4. crypto ipsec transform-set aaset esp-aes 256 esp-sha256-hmac

```
mode tunnel
```

5. crypto map ike_v2_map 10 ipsec-isakmp

```
set peer <IP address>
set transform-set aaset
set ikev2-profile ike_v2_profile
match address ike_v2_acl
```

6. ip access-list extended ike_v2_acl

```
permit ip <local subnet> 0.0.0.255 <remote subnet> 0.0.0.255
```

7. interface GigabitEthernet0

```
ip address <IP address> <mask>
duplex auto
speed auto
no keepalive
crypto map ike_v2_map
```

8. exit

9. show crypto ikev2 session

3.3 Windows Computer IPsec Tunnel with Advantech Router

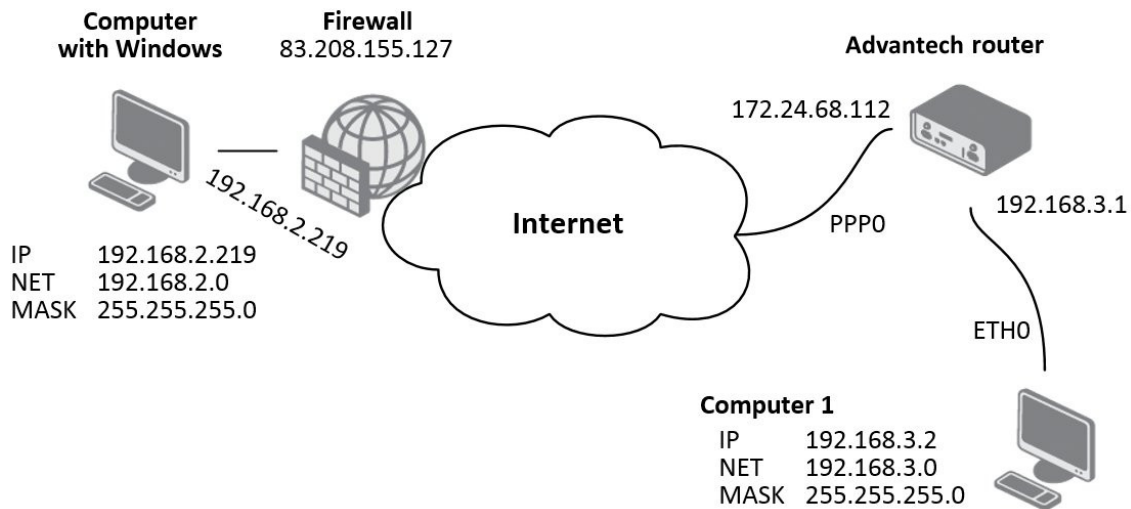

Figure 17: IPsec tunnel – Windows

Recommended program for Windows operating system is *NCP Secure Entry Client* on which the following description is based on.

3.3.1 Windows IPsec Configuration – NCP Secure Entry Client

The figure below shows the environment of the NCP Secure Entry Client (version 9.32, build 218).

Figure 18: NCP Secure Entry Client

First it is necessary to create a profile for establishing IPsec tunnel. Select *Configuration* tab in the menu (of NCP Secure Entry Client program) and then select *Profiles* item. The following window will be open:

Add a new profile using the *Add/Import* button. On the second screen, you must enter the profile name. In other cases (on the other screens) it is possible only to confirm using the *Next* button (on the last screen using the *Finish* button) and make the necessary settings later.

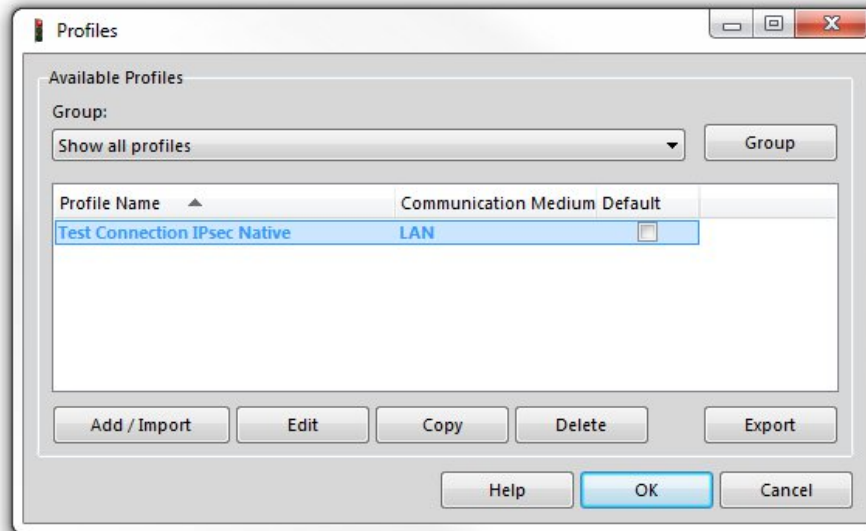

Figure 19: NCP Secure Entry Client – Profiles

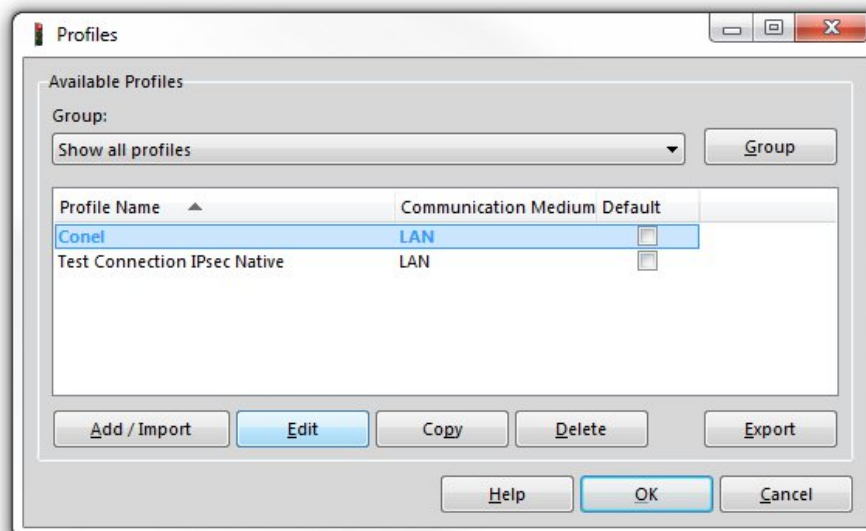

Figure 20: NCP Secure Entry Client – Edit

Configuration of the IPsec tunnel is done by marking the profile and pressing *Edit* button.

Select *IPsec General Settings* item in the menu on the left side. Then press *Police Editor...* button on the right side.

In the new window highlight the *Pre-shared Key* item (in *IKE Policy* section) and then press *Edit* button.

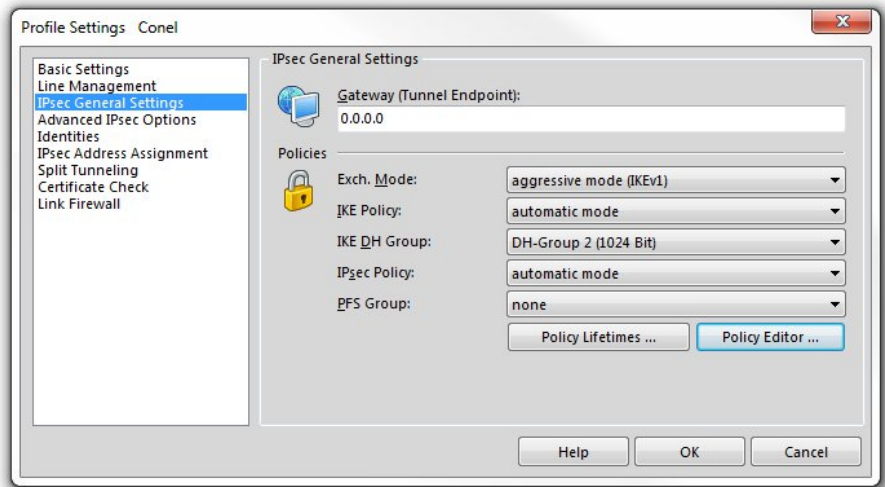

Figure 21: NCP Secure Entry Client – IPsec General Settings

Figure 22: NCP Secure Entry Client – Policy Editor

This opens a window in which select encryption and hash algorithm (for example *Triple DES* and *MD5*) and then confirm by pressing the *OK* button.

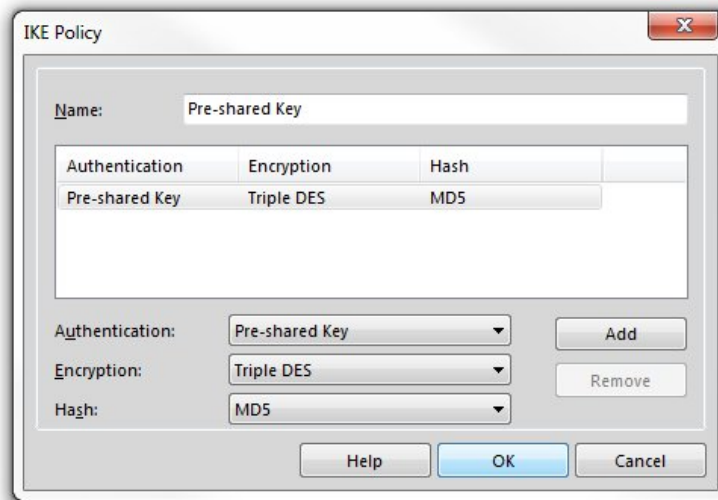

Figure 23: NCP Secure Entry Client – Pre-shared Key

Now, select the only available item in *IPsec Policy* section of configuration window. The item has a name *ESP - AES128 - MD5*. Then press *Edit* button.

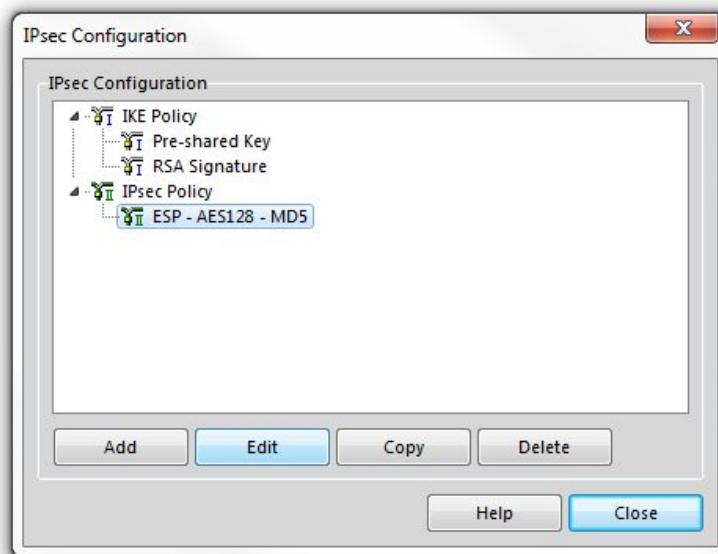

Figure 24: NCP Secure Entry Client – Policy Editor

Enter the desired name (for example *IPsec*) in the new window and select encryption and hash algorithm (for example *Triple DES* and *MD5*). Then confirm it by pressing the *OK* button.

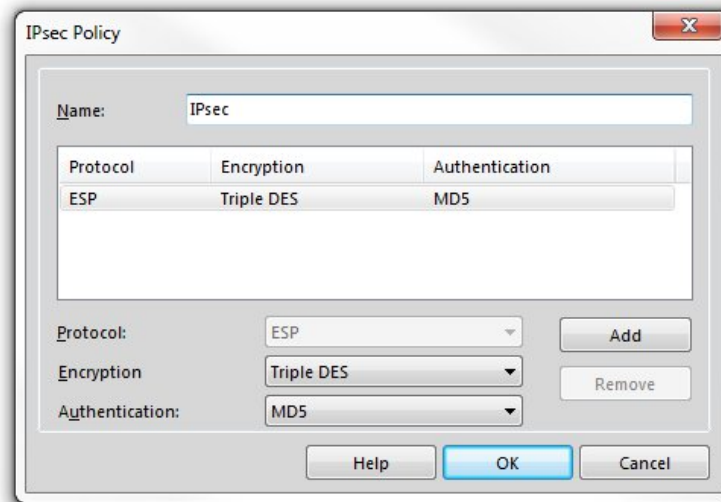

Figure 25: NCP Secure Entry Client – IPsec Policy

Go back to the main window of *IPsec General Settings* item and set *IKE Policy* and *IPsec Policy* items based on the previous configuration (see the figure below). *IKE DH Group* item will have a value of *DH-Group 2 (2014 bit)*.

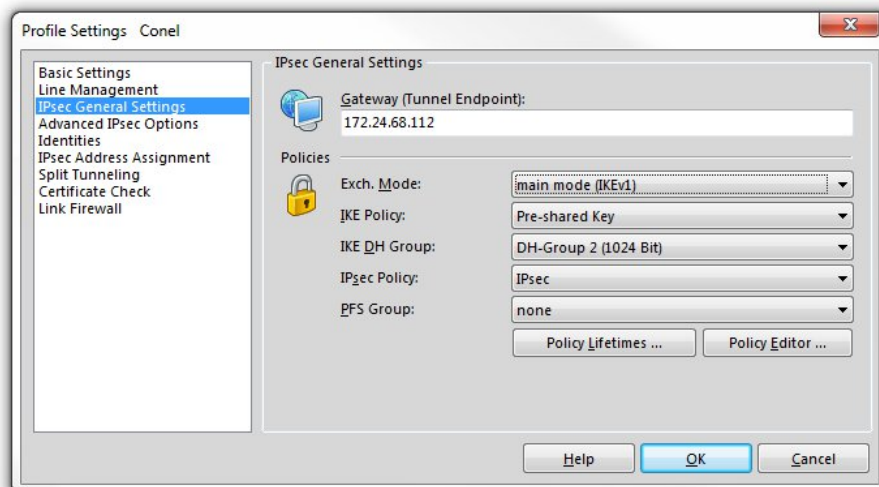

Figure 26: NCP Secure Entry Client – IPsec General Settings

Now, select *Identities* item in the menu on the left side and fill in the configuration form as shown below. Note that the IP address corresponds to the exemplary situation from the beginning of this section.

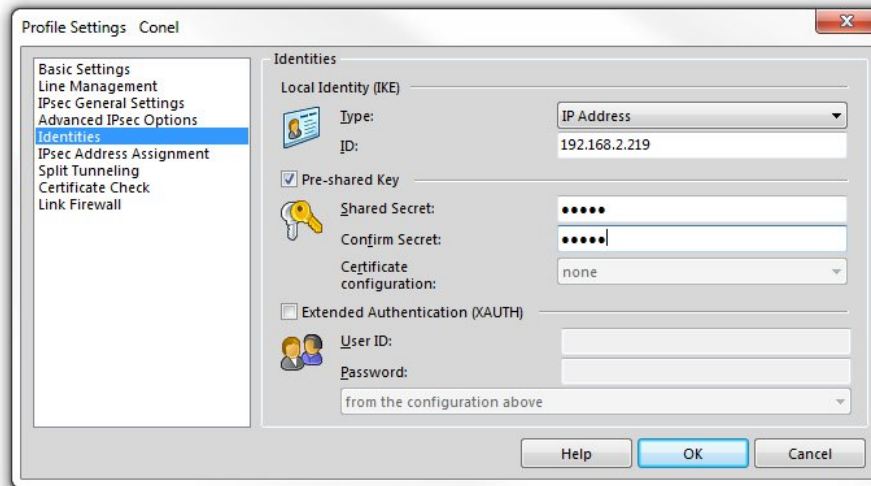

Figure 27: NCP Secure Entry Client – Identities

The same IP address (192.168.2.219 according to the exemplary situation) is also required on the *IPsec Address Assignment* page.

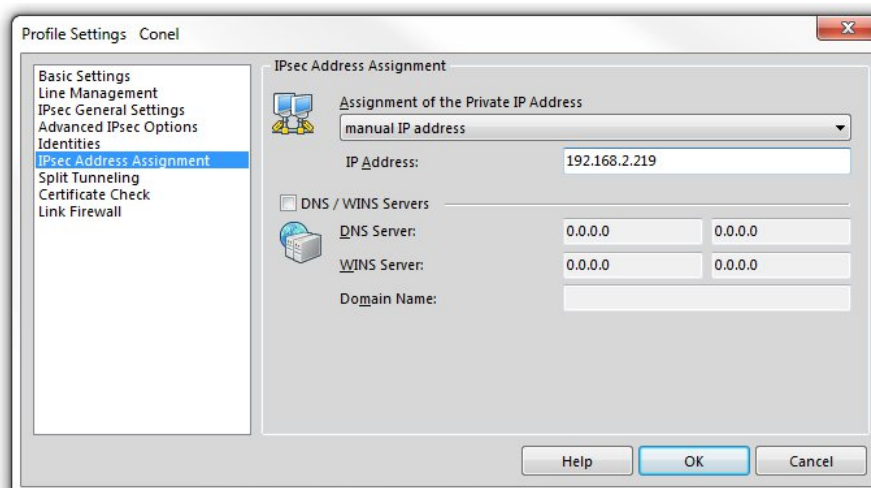

Figure 28: NCP Secure Entry Client – IPsec Address Assignment

Press *Add* button on the *Split Tunneling* page and enter the IP address of the subnet behind the router Advantech (192.168.3.0 in the exemplary situation) and relevant subnet mask (255.255.255.0) to the newly opened window. Confirm it by pressing the *OK* button.

Figure 29: NCP Secure Entry Client – Add IP network

Specified data are displayed in the original window of the *Split Tunneling* page.

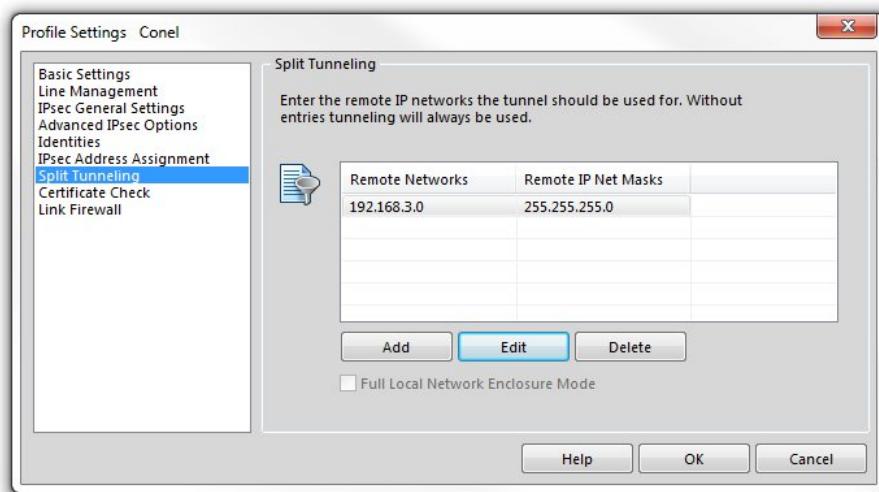

Figure 30: NCP Secure Entry Client – Split Tunneling

3.3.2 IPsec Configuration of Advantech Router

On the following page is displayed configuration form with IPsec tunnel settings. Entered values correspond to the exemplary situation from the beginning of this section.

3.5 Known Issues

3.5.1 Several Subnets in one CHILD_SA

If you use IKEv2, you can if the peers support it, some do not (e.g. devices by Checkpoint, Cisco and Fortinet, see interoperability¹ for details).

If you are using strongSwan with different IPsec solution, please consult <https://wiki.strongswan.org/projects/strongswan/wiki/Interoperability> in case of any problems before contacting our technical support.

¹<https://wiki.strongswan.org/projects/strongswan/wiki/Interoperability>

4. Related Documents

You can obtain product-related documents on the **Engineering Portal** at icr.advantech.com.

To access your router's documents or firmware, go to the [Router Models](#) page, locate the required model, and select the appropriate tab below.

Documents that are common to all models and describe specific functionality areas are available on the [Application Notes](#) page.

The **Router Apps** installation packages and manuals are available on the [Router Apps](#) page.

If you are interested in further options for extending router functionality, either through scripts or custom Router Apps, please see the information available on the [Development](#) page.

Appendix A: openssl.conf

```
#
# OpenSSL example configuration file.
# This is mostly being used for generation of certificate requests.
#

# Note that you can include other files from the main configuration
# file using the .include directive.
#.include filename

# This definition stops the following lines choking if HOME isn't
# defined.
HOME = .
RANDFILE = $ENV::HOME/.rnd

# Extra OBJECT IDENTIFIER info:
#oid_file = $ENV::HOME/.oid
